

## **Title**

rdpower — Power calculations for Regression Discontinuity designs using robust bias-corrected local polynomial inference.

#### Syntax

rdpower depvar runvar [if] [in] [, c(#) tau(#) alpha(#) nsamples(# # # #) sampsi(#
 #) samph(# #) all plot graph\_range(# #) graph\_step(#) graph\_options(graph\_opt)
 bias(# #) variance(# #) covs(covars) deriv(#) p(#) q(#) h(# #) b(# #) rho(#)
 fuzzy(fuzzyvar [sharpbw]) kernel(kernelfn) bwselect(bwmethod) vce(vcetype
 [vceopt1 vceopt2]) scalepar(#) scaleregul(#) ]

# **Description**

rdpower provides power calculations in Regression Discontinuity designs using
 conventional and robust bias-corrected local polynomial methods. Companion
 command is: rdsampsi for sample size calculations.

A detailed introduction to this command is given in <a href="Cattaneo, Titiunik and Gonzalo Vazquez-Bare">Cattaneo, Titiunik and Gonzalo Vazquez-Bare</a> (2018).

Companion R functions are also available <u>here</u>.

This command employs the Stata (and R) package <u>rdrobust</u> for underlying calculations. See <u>Calonico</u>, <u>Cattaneo and Titiunik</u> (2014) and <u>Calonico</u>, <u>Cattaneo</u>, <u>Farrell and Titiunik</u> (2017) for more details.

Related Stata and R packages useful for inference in RD designs are described in the following website:

https://sites.google.com/site/rdpackages/

# Options

- c(#) specifies the RD cutoff for indepvar. Default is c(0).
- tau(#) specifies the treatment effect under the alternative at which the power function is evaluated. The default is half the standard deviation of the outcome for the untreated group.
- alpha(#) specifies the significance level for the power function. Default is alpha(.05).
- nsamples(# # # #) sets the total sample size to the left, sample size to the left
  inside the bandwidth, total sample size to the right and sample size to the
  right of the cutoff inside the bandwidth to calculate the variance when the
  running variable is not specified. When this option is not specified, the
  values are calculated using the running variable.
- sampsi(# #) sets the sample size at each side of the cutoff for power calculation.
  The first number is the sample size to the left of the cutoff and the second
  number is the sample size to the right. Default values are the sample sizes
  inside the chosen bandwidth.
- samph(# #) sets the bandwidths at each side of the cutoff for power calculation.
  The first number is the bandwidth to the left of the cutoff and the second
  number is the bandwidth to the right. Default values are the bandwidths used
  by rdrobust.
- all displays the power using the conventional variance estimator, in addition to the robust bias corrected one.
- plot plots the power function using the robust bias corrected standard error from
   rdrobust. If all is specified, the conventional power function is also
   plotted.

- graph\_range(# #) specifies the range of the plot when plot option is used.
   Default range is [-1.5\*tau; 1.5\*tau].
- graph\_step(#) specifies the step increment of the plot when plot option is used.
   Default range is 0.2\*range.
- graph\_options(#) specifies the graph options (title, axes titles, etc) to be passed to the plot when plot option is used.
- bias(# #) allows the user to set bias to the left and right of the cutoff. If not specified, the biases are estimated using rdrobust.
- variance(# #) allows the user to set variance to the left and right of the cutoff.
  If not specified, the variances are estimated using rdrobust.
- The following options are passed directly to rdrobust:
- covs(covars) specifies additional covariates to be used for estimation and inference.
- deriv(#) specifies the order of the derivative of the regression functions to be
   estimated. Default is deriv(0). Setting deriv(1) results in estimation of a
   Kink RD design (up to scale).
- p(#) specifies the order of the local polynomial used to construct the point estimator. Default is p(1) (local linear regression).
- ${\tt q(\#)}$  specifies the order of the local polynomial used to construct the bias correction. Default is  ${\tt q(2)}$  (local quadratic regression).
- h(##) specifies the main bandwidth (h) used to construct the RD point estimator. If not specified, bandwidth h is computed by the companion command  $\underline{rdbwselect}$ . If two bandwidths are specified, the first bandwidth is used for the data below the cutoff and the second bandwidth is used for the data above the cutoff.
- b(# #) specifies the bias bandwidth (b) used to construct the bias-correction
   estimator. If not specified, bandwidth b is computed by the companion command
   rdbwselect. If two bandwidths are specified, the first bandwidth is used for
   the data below the cutoff and the second bandwidth is used for the data above
   the cutoff.
- **rho**(#) specifies the value of *rho*, so that the bias bandwidth b equals b=h/rho. Default is **rho**(1) if h is specified but b is not.
- fuzzy(fuzzyvar [sharpbw]) specifies the treatment status variable used to
   implement fuzzy RD estimation (or Fuzzy Kink RD if deriv(1) is also
   specified). Default is Sharp RD design and hence this option is not used. If
   the option sharpbw is set, the fuzzy RD estimation is performed using a
   bandwidth selection procedure for the sharp RD model. This option is
   automatically selected if there is perfect compliance at either side of the
   threshold.
- kernel(kernelfn) specifies the kernel function used to construct the
   local-polynomial estimator(s). Options are: triangular, epanechnikov, and
   uniform. Default is kernel(triangular).
- **bwselect** (bwmethod) specifies the bandwidth selection procedure to be used. By default it computes both h and b, unless rho is specified, in which case it only computes h and sets b=h/rho. Options are:
  - $\boldsymbol{mserd}$  one common MSE-optimal bandwidth selector for the RD treatment effect estimator.
  - msetwo two different MSE-optimal bandwidth selectors (below and above the cutoff) for the RD treatment effect estimator.
  - msesum one common MSE-optimal bandwidth selector for the sum of regression
     estimates (as opposed to difference thereof).
  - msecomb1 for min(mserd, msesum).
  - msecomb2 for median(msetwo,mserd,msesum), for each side of the cutoff
    separately.
  - ${\tt cerrd}$  one common CER-optimal bandwidth selector for the RD treatment effect estimator.
  - certwo two different CER-optimal bandwidth selectors (below and above the

```
cutoff) for the RD treatment effect estimator.
   cersum one common CER-optimal bandwidth selector for the sum of regression
       estimates (as opposed to difference thereof).
    cercomb1 for min(cerrd, cersum).
    cercomb2 for median(certwo,cerrd,cersum), for each side of the cutoff
       separately.
   Note: MSE = Mean Square Error; CER = Coverage Error Rate.
   Default is bwselect (mserd). For details on implementation, see rdbwselect and
       references therein.
vce(vcetype [vceopt1 vceopt2]) specifies the procedure used to compute the
    variance-covariance matrix estimator. Options are:
   vce(nn [nnmatch]) for heteroskedasticity-robust nearest neighbor variance
       estimator with nnmatch indicating the minimum number of neighbors to be
       used.
    vce(hc0) for heteroskedasticity-robust plug-in residuals variance estimator
       without weights.
    vce(hc1) for heteroskedasticity-robust plug-in residuals variance estimator
       with hcl weights.
   vce(hc2) for heteroskedasticity-robust plug-in residuals variance estimator
       with hc2 weights.
   vce(hc3) for heteroskedasticity-robust plug-in residuals variance estimator
        with hc3 weights.
   vce(nncluster clustervar [nnmatch]) for cluster-robust nearest neighbor
       variance estimation using with clustervar indicating the cluster ID
       variable and nnmatch matches indicating the minimum number of neighbors to
       be used.
    vce(cluster clustervar) for cluster-robust plug-in residuals variance
       estimation with degrees-of-freedom weights and clustervar indicating the
       cluster ID variable.
    Default is vce(nn 3).
scalepar(#) specifies scaling factor for RD parameter of interest. This option is
    rescaling (e.g., Sharp Kink RD). Default is scalepar(1) (no rescaling).
scaleregul(#) specifies scaling factor for the regularization term added to the
    denominator of the bandwidth selectors. Setting scaleregul(0) removes the
    regularization term from the bandwidth selectors. Default is scalerequl(1).
```

- useful when the estimator of interest requires a known multiplicative factor

## Example: Cattaneo, Frandsen and Titiunik (2015) Incumbency Data

```
. use rdpower_senate.dta
Power calculation against an alternative hypothesis of tau = 5
    . rdpower demvoteshfor2 demmv, tau(5)
Power calculation with covariates
    . rdpower demvoteshfor2 demmv, tau(5) covs(population dopen dmidterm)
Power calculation with user-specified bandwidths
    . rdpower demvoteshfor2 demmv, tau(5) h(16 18) b(18 20)
Power function plot with default options
    . rdpower demvoteshfor2 demmv, tau(5) plot
Power function plot with user-specified range and step
    . rdpower demvoteshfor2 demmv, tau(5) plot graph_range(-9 9) graph_step(2)
Power function plot with user-specified options
    . rdpower demvoteshfor2 demmv, tau(5) plot graph_range(-9 9) graph_step(2)
    graph_options(title(Power function) xline(0, lcolor(black) lpattern(dash))
    xtitle(tau) ytitle(power) graphregion(fcolor(white)))
```

## Saved results

## rdpower saves the following in r():

```
Scalars
 r(alpha)
                      significance level used in power function
                      treatment effect under alternative hypothesis
  r(tau)
 r(N_h_1)
                      sample size in bandwidth to the left used to calculate
                        variance
 r(N_h_r)
                      sample size in bandwidth to the right used to calculate
                       variance
 r(N_1)
                      sample size to the left used to calculate variance
 r(N_r)
                      sample size to the right used to calculate variance
                      bandwidth to the left of the cutoff
 r(samph_1)
  r(samph_r)
                     bandwidth to the right of the cutoff
                     number of observations inside the window to the left of
  r(sampsi_1)
                       the cutoff
 r(sampsi_r)
                    number of observations inside the window to the right of
                       the cutoff
  r(se_rbc)
                     robust bias corrected standard error
 r(power_rbc)
                    power against tau using robust bias corrected standard
                        error
                     conventional standard error
  r(se_conv)
                   power against tau using conventional standard error robust variance to the left of the cutoff
 r (power_conv)
  r(Vl_rb)
  r(Vr_rb)
                      robust variance to the left of the cutoff
                     bias to the left of the cutoff
  r(bias_l)
                     bias to the left of the cutoff
  r(bias_r)
```
